## Measuring the “SHADOW” of artificial structures in the North Sea and its effect on the surrounding soft bottom community

Furu Mienis, Gerard Duineveld, Marc Lavaleye, Magda Bergman, Rob  
Witbaard, Karline Soetaert, Stig Westerlund and Gert-Jan Reichart

# Coral growing on North Sea oil rigs

These installations are home to thriving colonies of an endangered cold-water coral.

This summer the coral *Lophelia pertusa* was found growing on oil platforms in the North Sea and on the Brent Spar oil-storage buoy during its decommission-

The occurrence of the coral raises questions about how to deal with this species, which is listed under the Convention on International Trade in Endangered Species (CITES), when platforms are decommissioned. At a meeting in Sintra in 1998 of

*Mytilus edulis*

*Metridium senile*

Ron Tackett © 2005

*Lophelia pertusa*

Platform, currently in Den Helder

Artificial structures offer hard substrate for sessile epifauna

Biomass is estimated to be up to 500-fold the biomass as found on soft sediment (*Picken et al., 2000*)

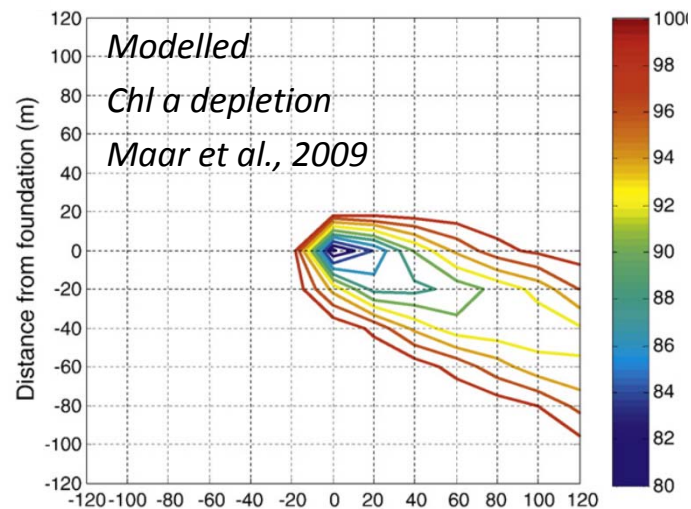

Community may act as biofilter and cast a "SHADOW" in immediate surroundings

## Hypothesis

Through the presence of a rich epifaunal community, oil/gas platforms in the North Sea may act as:

1. **biofilters** creating a “SHADOW” affecting the water column and soft-bottom benthic surrounding.
2. **stepping stones** for species enhancing biodiversity in the wider North Sea.

## Objectives “SHADOW”

1. Examine whether artificial structures act as biofilter and create a “SHADOW”
2. Examine whether the “SHADOW” has an impact on the surrounding benthic community
3. Model the “SHADOW” affect
4. Define whether platforms are stepping stones

## Relevance

*"establish the magnitude of the effects of man-made structures compared to the spatial and temporal variability of the North Sea ecosystem, considered on different time and space scales"*

Following a multi-disciplinary approach, whereby biological, geological, physical and chemical data will be combined, the influence will be assessed of man-made structures on the benthic ecosystems surrounding these platforms in space and time. -> field data and models

*"to what extent, if any, the man-made structures in the North Sea represent a large inter-connected hard substrate system"*

Our data i.e. larvae and their barcodes, will be combined with barcode data collected by other consortia studying epifauna communities on several other platforms in the North Sea.

## Study area

## Platform L7-A

### Facts and figures

- Location: 47 nautical miles northwest of Den Helder
- Platform is no longer in use
- Length x breadth: 20 m x 6 m
- Height of helideck: approx. 30 m
- Water depth: 40 m
- First gas produced: October 1988
- Last gas produced: February 1999

ICES Journal of Marine Science Advance Access published May 16, 2007

## Effects of an area closed to fisheries on the composition of the benthic fauna in the southern North Sea

Gerard C. A. Duineveld, Magda J. N. Bergman, and Marc S. S. Lavaleye

Duineveld, G. C. A., Bergman, M. J. N., and Lavaleye, M. S. S. 2007. Effects of an area closed to fisheries on the composition of the benthic fauna in the southern North Sea – ICES Journal of Marine Science, 64.

The effects of fishery exclusion on the composition of the macrofauna were determined by comparing the fishery-exclusion zone around a gas production platform in the southern North Sea (Frisian Front) with nearby regularly fished areas. A Triple-D dredge

## Platform L7A

- Platform clear of discharge of toxic waste
- Non trawling zone of 500 m

## Cruise with the RV Pelagia

7-12 May 2016

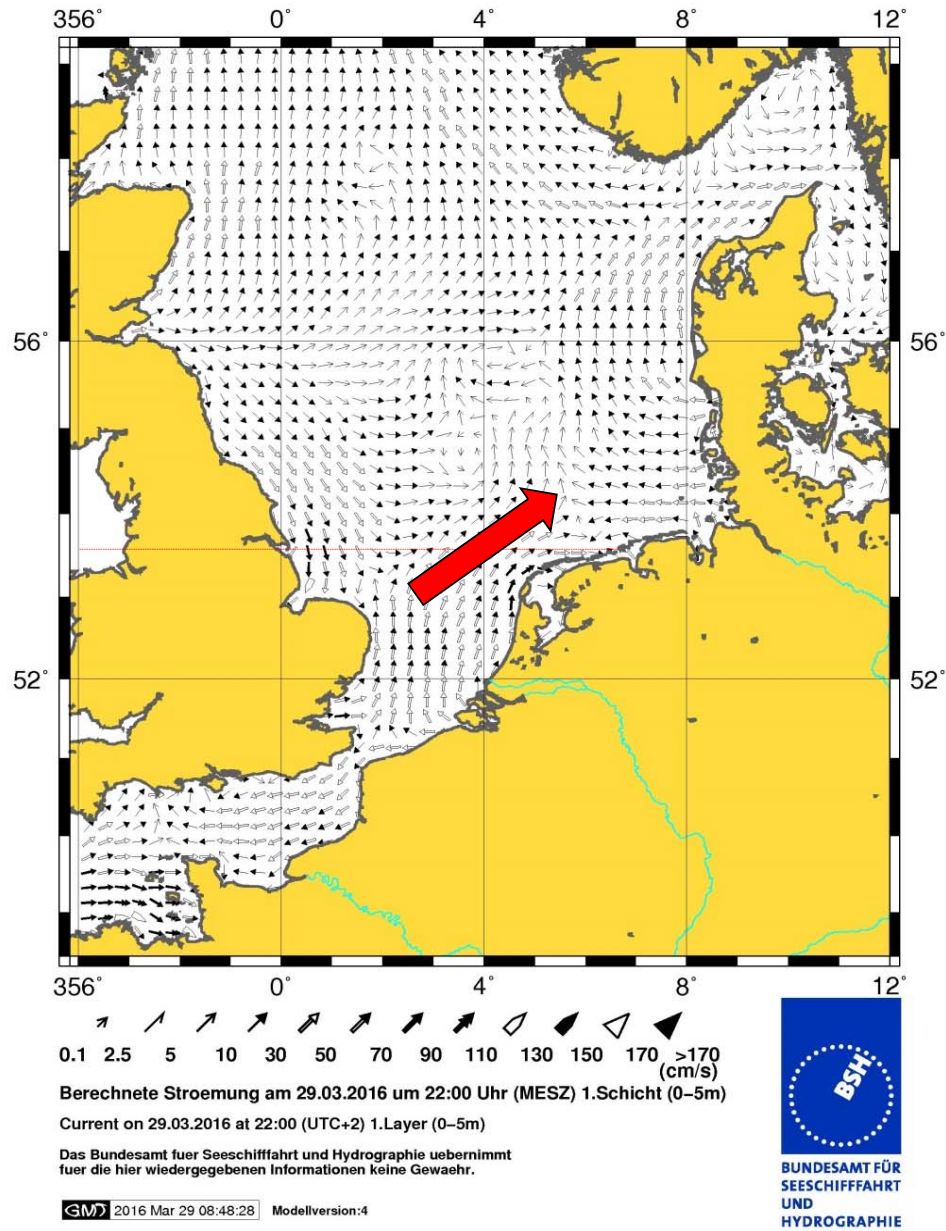

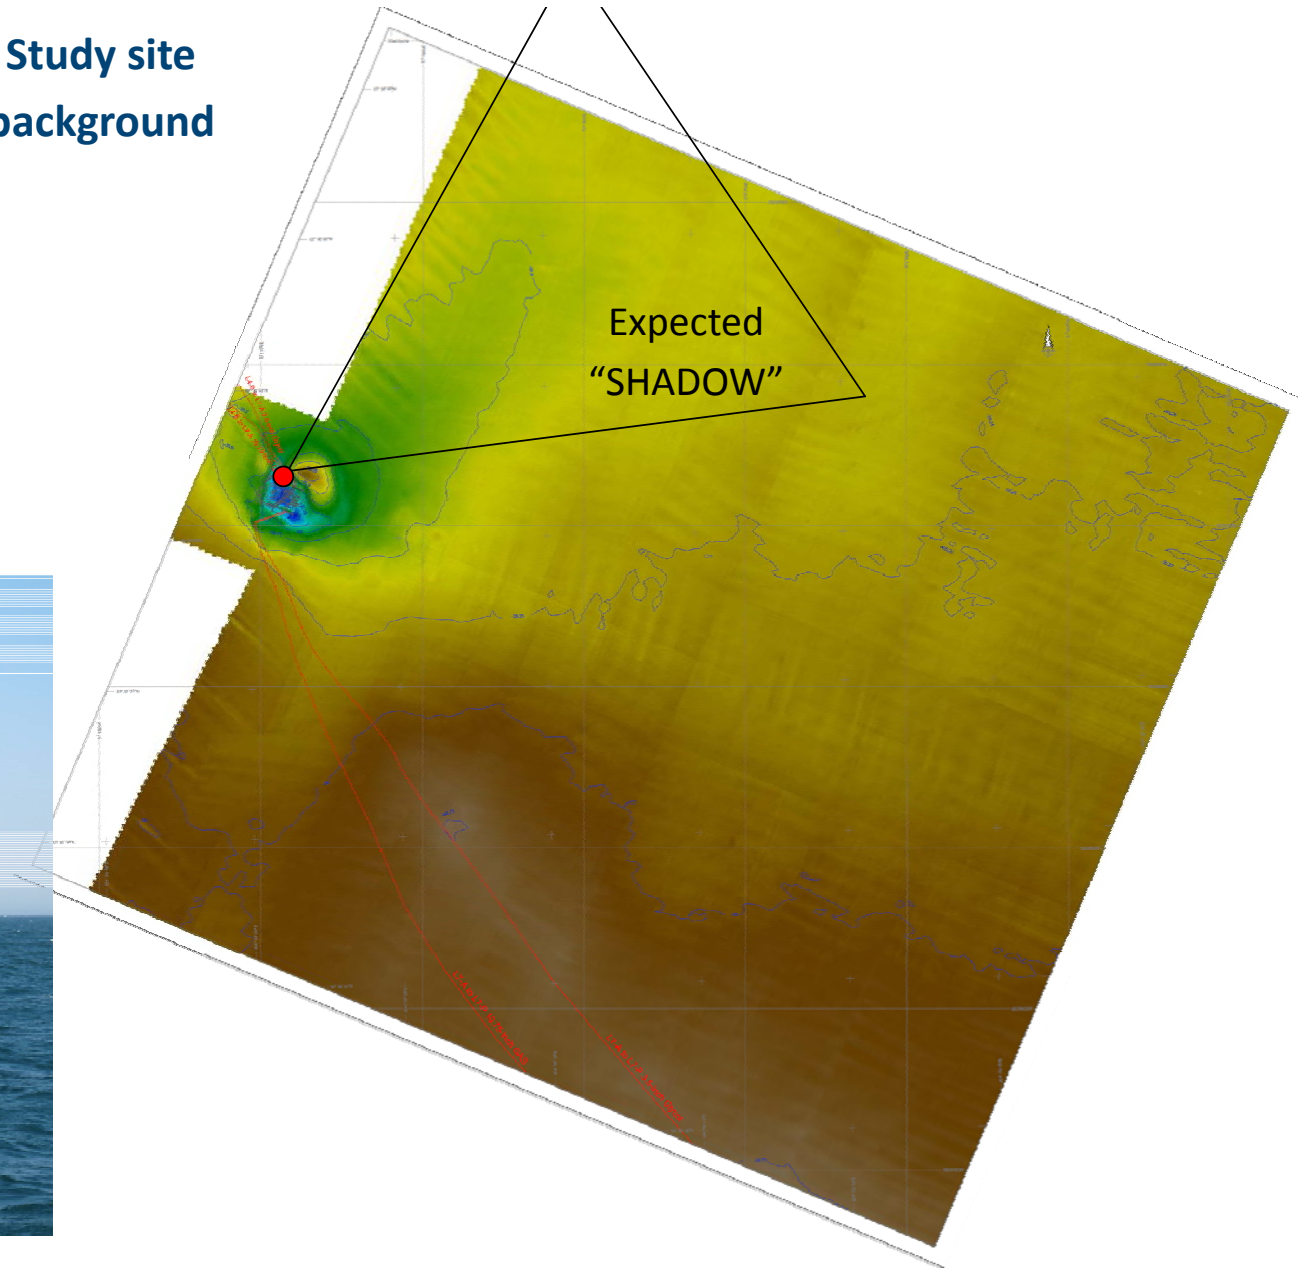

## Study site background

## Study site background

## Objective 1

Examine whether artificial structures act as biofilter and create a  
“SHADOW”

- Hydrodynamics
- Biogeochemistry (particulate and dissolved)

*Water column profiling and sampling (POM, nutrients, DOC, DIC, DNA) with the CTD/Rosette*

*NIOZ in-house designed benthic observatories: platforms for multitude of sensors*

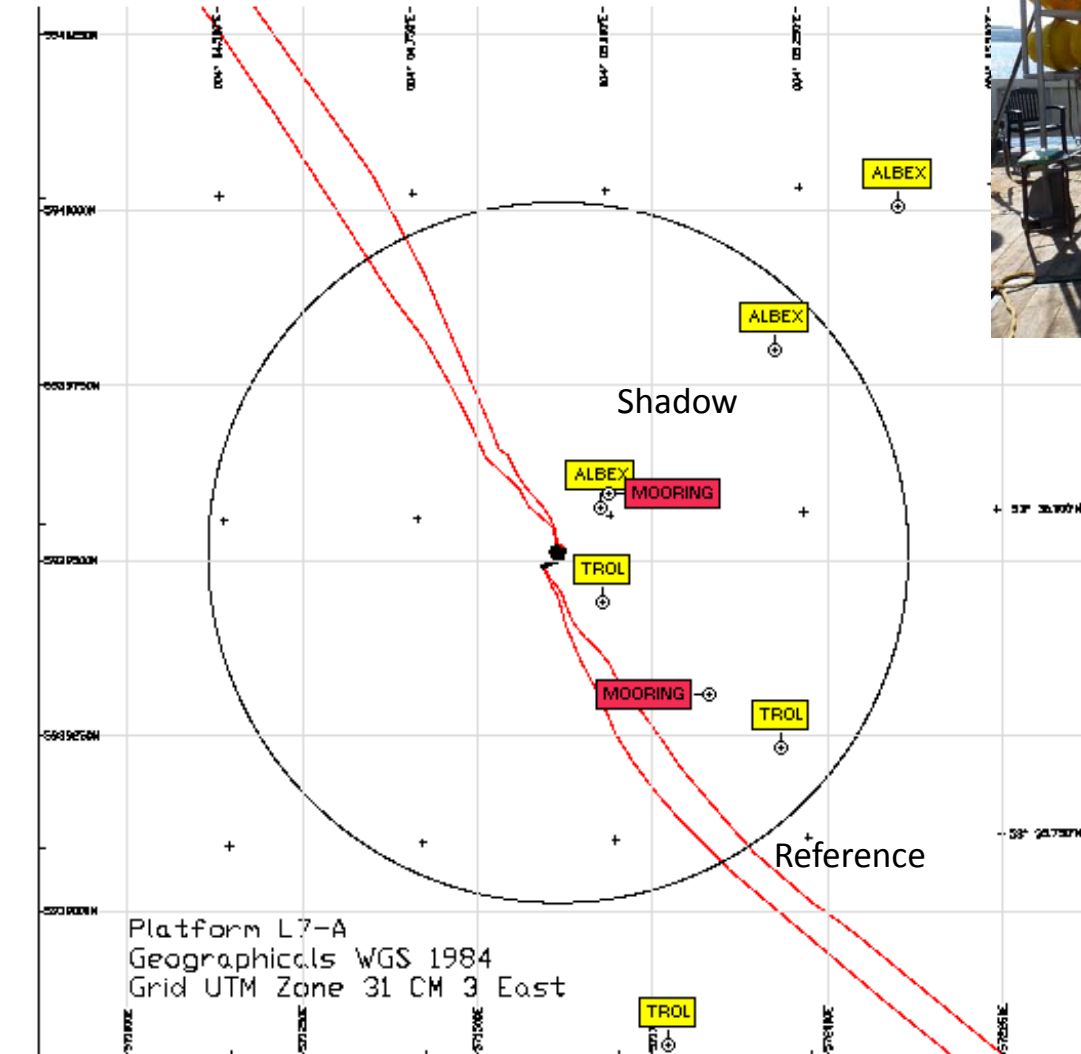

## Sampling approach: CTD

## Sampling approach: landers

Monitoring with bottom landers:

3 deployments of ~24 hours

- 100 m
- 300 m
- 700 m

Moorings - long term

## Results -> Landers at 100 m from platform

### Shadow

### Reference

## Long term monitoring

Two moorings deployed -> to capture impact of meteorological forcing, spring and neap tidal cycles and seasonal changes

Moorings will be recovered 10-15 December 2016

## Objective 2

Examine whether the “SHADOW” has an impact on the surrounding benthic community

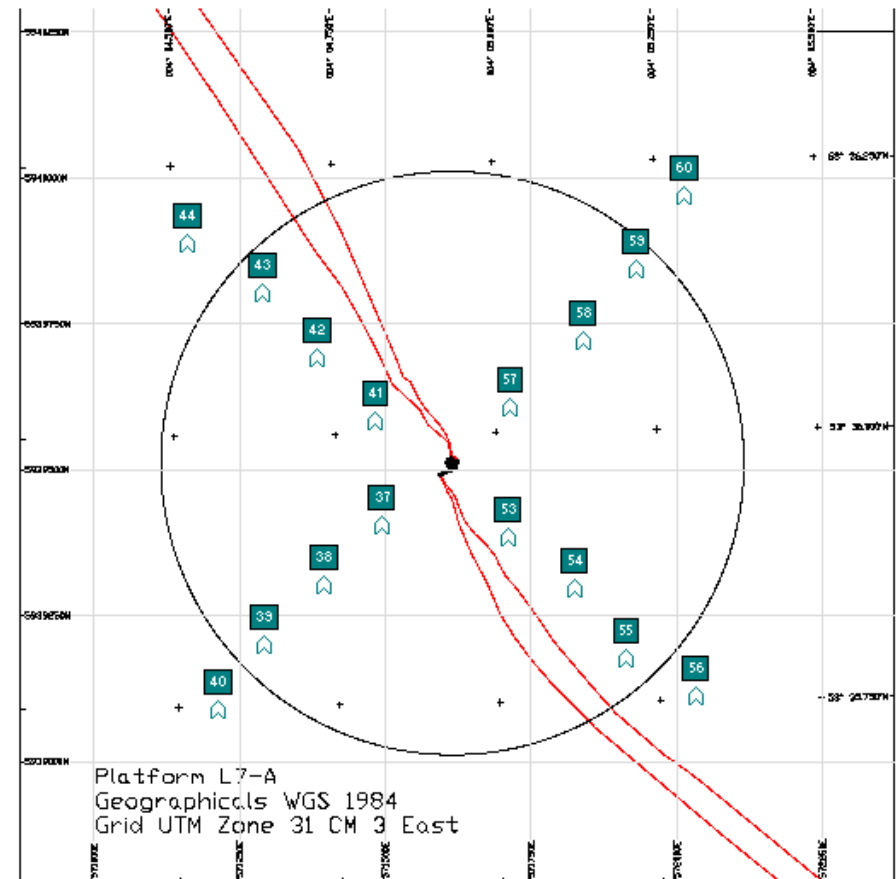

Sediment cores ->  
fauna and sedimentology

HD camera observations to  
define substrate and faunal  
abundance

## Sampling approach

4 BC transects  
Samples taken for barcoding,  
sedimentology and fauna

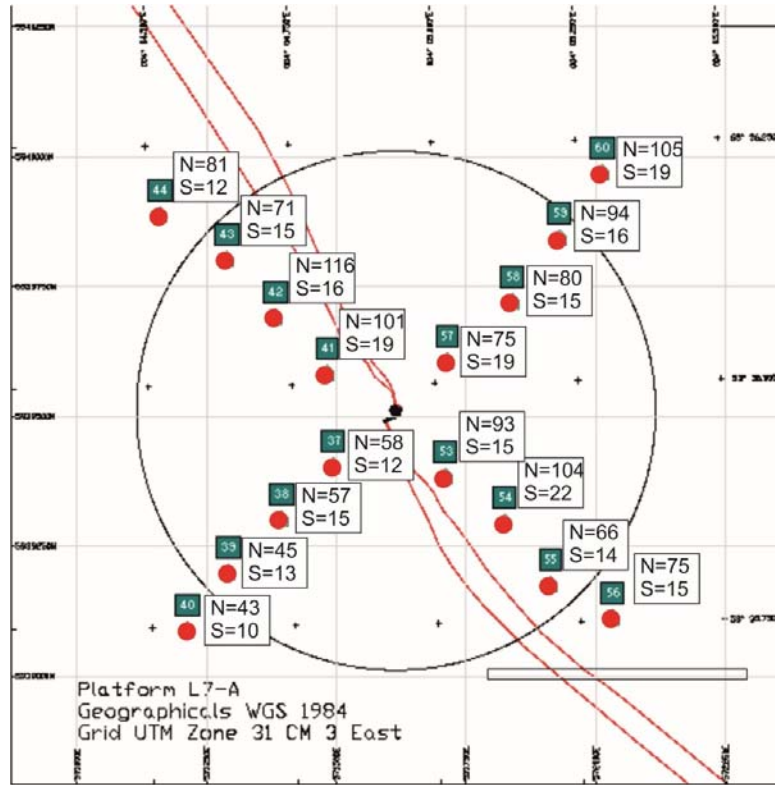

## Results-> bottom sampling

Species name	SumOfNumber		
<i>Amphiura filiformis</i>	641	brittle star	filterfeeder
<i>Lumbrineris spec.</i>	116	bristle worm	carnivore
Phoronida	101	phoronid (special phylum)	filterfeeder
<i>Callianassa subterranea</i>	87	burrowing shrimp	deposit feeder
<i>Corbula gibba</i>	42	small bivalve	filterfeeder
<i>Ophiodromus flexuosus</i>	35	bristle worm	carnivore
<i>Nucula nitidosa</i>	26	small bivalve	deposit feeder
<i>Nereis longissima</i>	23	bristle worm	carnivore
<i>Upogebia deltaura</i>	23	burrowing shrimp	deposit feeder

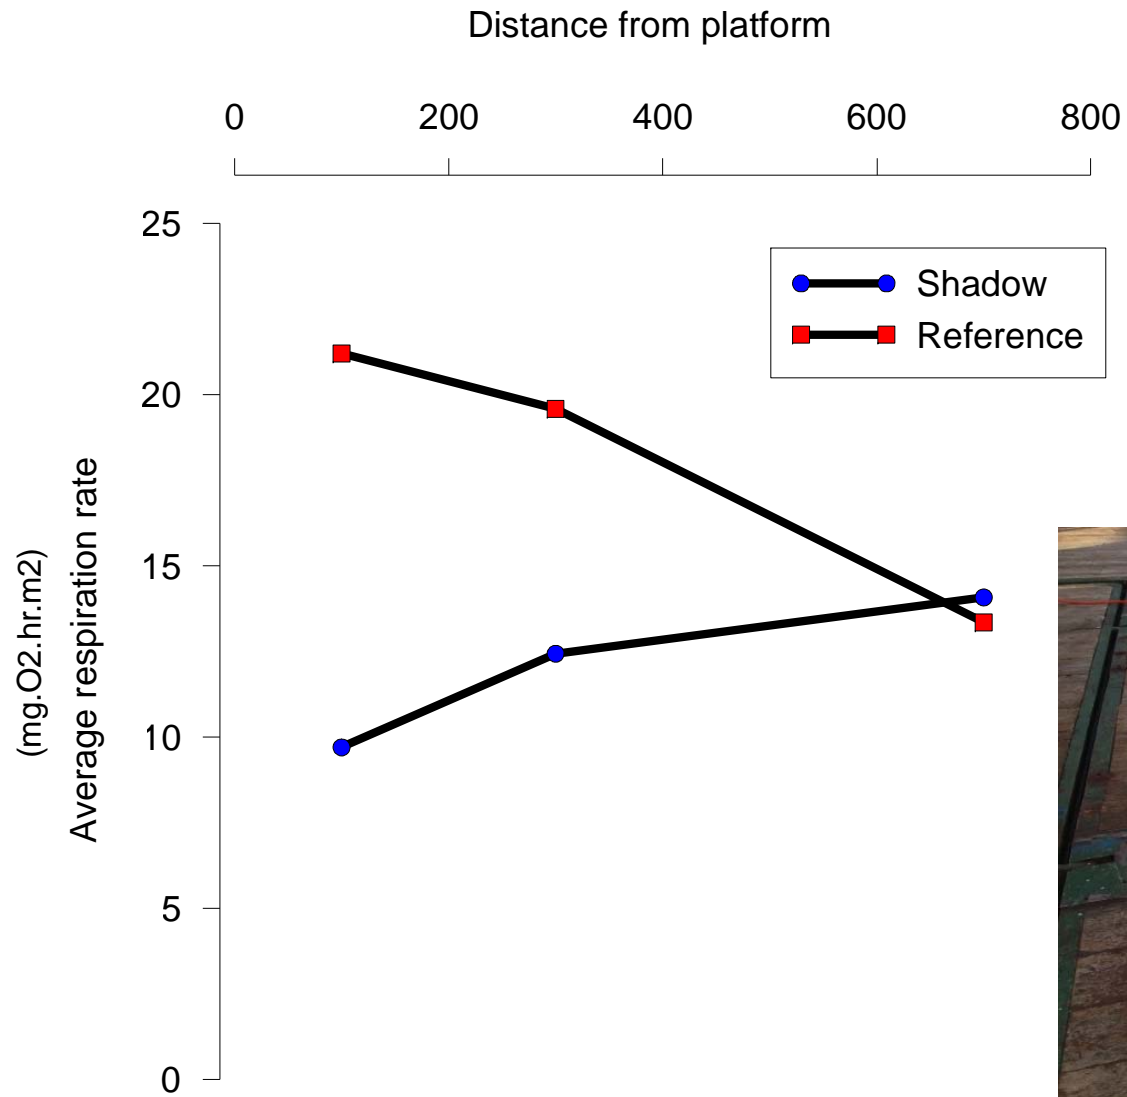

- Number of species
- Number of Individuals

## Results -> respiration experiments

## Objective 3

### Model the “SHADOW”

To investigate the extent of the SHADOW and potential food alteration.

Coupling pelagic and benthic processes (e.g. GETM)

Main processes:

- primary production
- transport with currents and turbulence
- passive sinking
- (bio)deposition and resuspension
- uptake by benthic organisms
- pelagic decay
- ?

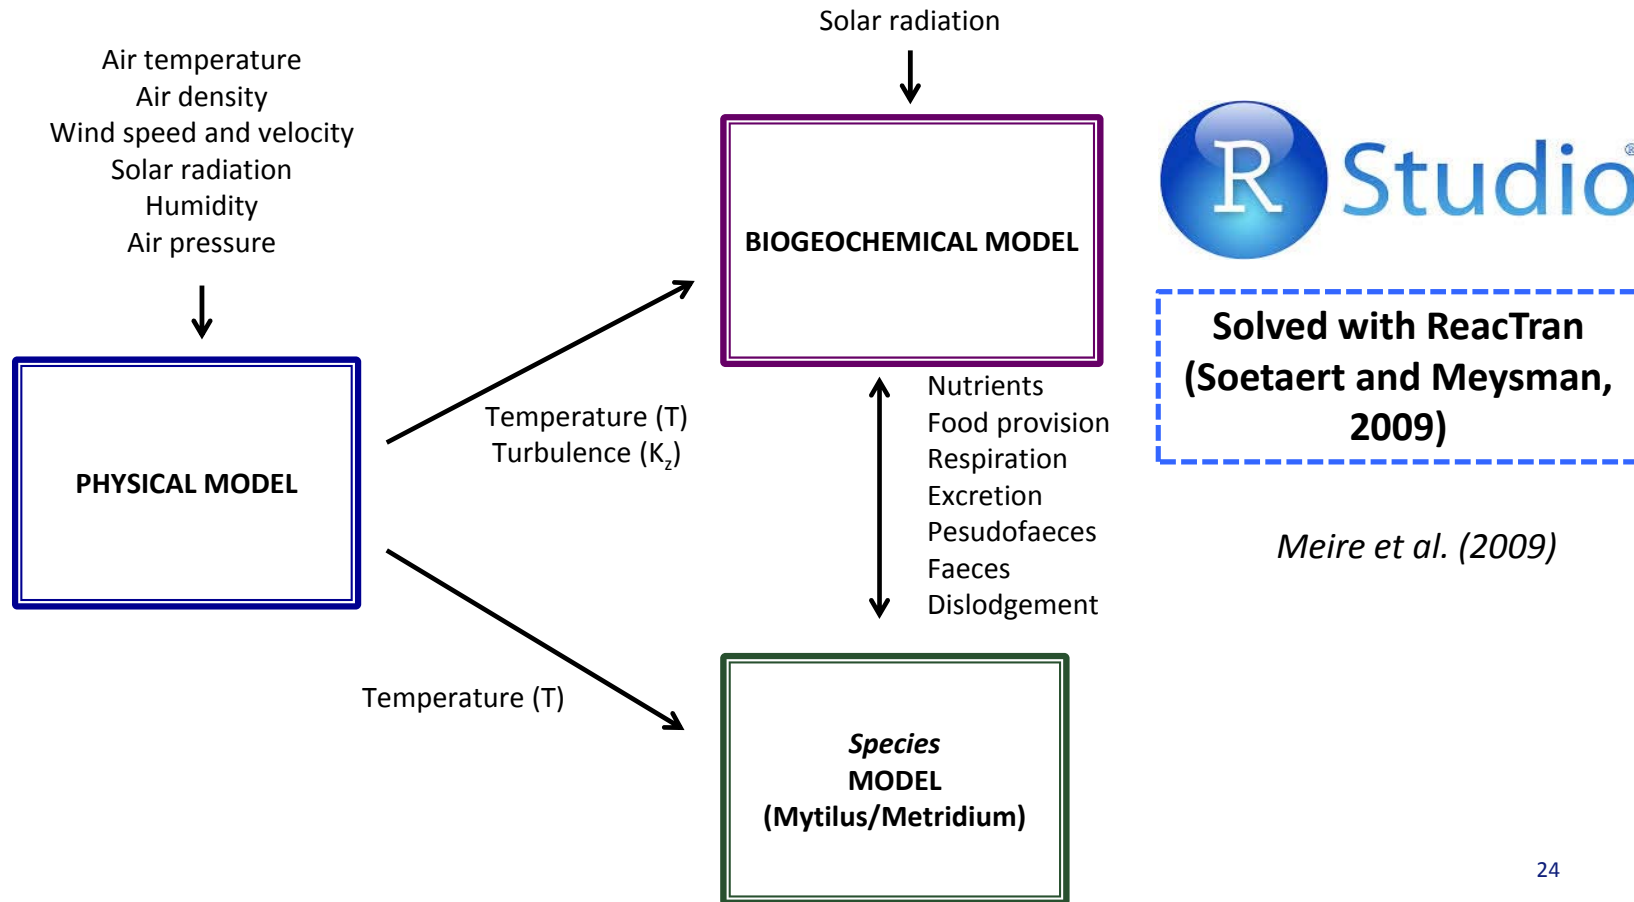

Mechanistic description of three main sessile feeding groups:  
filter feeders, passive suspension feeders, and deposit feeders

## One-dimensional model

### Three sub-models

## Objective 4

Define if platforms are stepping stones

*Samples from the environment*

- *Water column*
- *Sediment*

*Analyse with Next Gen Sequencing*

## Progress so far

Sampling

*Testing DNA extraction methods for the metabarcoding of marine (macro)benthic species (RECON)*

## Outlook

- Entangle natural variability from platform related variability
- Make a comparison between shallow and deep site (FRYGG-> Norwegian partners) in the North Sea
  
- Development of monitoring strategies (environmentals, key species, recovery potential)
- Learn from models and fill in data gaps -> improved models
